Laxmi Narsimha Reddy Jammula

Hands-on engineering leader · architecture & agentic AI · goes by "Narsimha"

14+ years building production software — 8+ hands-on as an engineer and data scientist, then 5+ leading teams while staying in the architecture and the code. Now building the coding-agent systems that do the shipping, and measuring whether they work.

software engineering, 8+ of them hands-on before managing	engineers led, owning 10–12 microservices and agents	agent harnesses benchmarked head-to-head

SUMMARY

Hands-on engineering leader with 14+ years building enterprise systems in Go, Java, C#, Python, and JavaScript: 8+ years as an engineer and data scientist shipping ML models into production, then 5+ years leading engineering teams while owning the architecture decisions — data stores, event-driven systems on Kafka, API contracts, production incident response. In 2026, building and running agentic AI systems: buildgate, an open-source agent factory with a permanent human merge gate, plus coding-agent harness hardening, benchmarks, and local LLM infrastructure.

AI & AGENTIC ENGINEERING — RECENT WORK (2026)

Independent, hands-on work run outside of core job responsibilities. Some underlying repositories are private; the public ones are listed under Public repos.

AGENT PLATFORM

buildgate

- Built buildgate, an open-source agent factory: a ticket and a spec go in, a coding agent works through a sandboxed build-and-verify loop, and a human gets a reviewable pull request. Merge and deploy stay human by design.
- Go orchestration on Temporal, a sandbox runtime with per-run network egress control and a spend meter, a React operator console, and an MCP endpoint for agents.

- A written safety contract whose invariants each map to the test that enforces them; measured by how many real tickets reach an accepted pull request with no human intervention, on Go, Python, Java, Ruby, and React Native repositories.

HARNESS ENGINEERING & EVALUATION

Coding-agent harness engineering & evaluation

- Harden and customize the Pi coding-agent harness for daily use: a pinned TypeScript contract test suite, a current-diff quality gate, project-scoped configuration overlays, stack-aware routing, an external-effect guard, symlink-safe path checks, versioned trace records, and a Docker containment profile.
- Design and run controlled agentic-coding benchmarks (Harbor framework, blinded model-based review, replicated trials) comparing four agent harnesses — Claude Code, Codex CLI, Copilot CLI, and Pi — across Go and Flutter/Dart tasks; also evaluates OpenClaw as a fifth.
- Diagnosed a decoding-configuration regression (disabled reasoning, undocumented greedy decoding) that flipped a replicated coding-benchmark result from 0/4 to 4/4, and built supporting evaluation tooling (stall detection, wall-clock budget nudging) used in later runs.

INFRASTRUCTURE

Local LLM infrastructure

- Operate multi-model local LLM inference serving code-generation, chat, web-search, and speech-to-text concurrently, with validated rollback procedures for every model swap — across two hardware generations: an NVIDIA DGX Spark (GB10) two-host cluster (llama-swap behind a LiteLLM proxy, Tailscale remote access), then a consolidated Apple MLX stack on a Mac Studio M3 Ultra.

MULTI-AGENT SYSTEMS

Personal multi-agent assistant (Hermes)

- Operate a personal AI assistant built on distinct agent profiles — a coding agent, a research agent, and a Kanban-style orchestrator agent — driven by cron-scheduled prompts, including one that runs an ongoing product-idea research pipeline end to end.

CROSS-PLATFORM PRODUCT

DayTrix & Personal Budget Simplifier

- Design, build, and ship DayTrix from one Flutter codebase to web, iOS, and Android, backed by a Go API. Live on the web now at personal-assistant-kkkbm3cwkq-uc.a.run.app (Google Cloud Run); iOS builds ship via Xcode Cloud → TestFlight. CI/CD to Cloud Run, Firebase backend services, and Playwright end-to-end test coverage.

- Also built Personal Budget Simplifier, a second Go + Flutter app (macOS, Windows, Linux, Web, iOS) for CSV-based budget tracking with a pure-Go SQLite backend.

AUTOMATION

Autonomous research agents

- Operate a nightly automated financial-research pipeline (FinRobot-based) covering 60 tickers and indices with automated retry/failure handling.
- Maintain a running daily research log tracking agent-protocol developments — Model Context Protocol (MCP) and Agent2Agent (A2A) — kept continuously since July 2026.
- Built an MCP server (Go + Python) exposing a task-management agent.

PROFESSIONAL EXPERIENCE

Senior Engineering Manager · Shipt

Dallas, TX (Remote) · Jun 2022–Present

- Lead a team of 8–11 engineers owning 10–12 asynchronous microservices and agents (Tier-0 services among them) for shopper efficiency and order fulfillment, with instrumentation, monitoring, and alerting built in
- Evolved Shipt's fulfillment promise toward faster, more flexible delivery windows for customers
- Built a human-in-the-loop agent that automates manual fulfillment interventions, cutting multi-day work to under an hour and improving fulfillment quality
- Built ask-agents that let Operations and Customer Support self-serve answers, replacing manual engineering troubleshooting with agent-driven diagnosis and saving engineering time
- Hands-on architect for the team's services: data-store choices (PostgreSQL as system of record, Redis for caching and idempotency), Kafka event payloads, and API contracts between services
- Lead production incident mitigation on Tier-0 services and the follow-up fixes that stop a recurrence; resolve design conflicts across teams
- Set the team's direction on agentic architecture and AI coding tools and frameworks
- Develop and maintain microservices in Go and Python on PostgreSQL, Redis, Kafka, and Docker

Software Engineering Manager · CareXM

Salt Lake City, UT · Dec 2020–Jun 2022

- Managed full-stack development and QA teams, onsite and offshore, delivering web, mobile (Xamarin), and desktop applications

- Architected and led the migration of a .NET Framework MVC application to microservices and a single-page app on Azure
- Set up CI/CD pipeline, ensured successful releases with proper observability & monitoring
- Pioneered integration test automation, established on-call support & incident alerting

Assistant Director, Data Science · **Progrexion** Salt Lake City, UT · Mar 2020–Dec 2020

- Managed Data Science, ML, and Software Development teams

Lead Data Scientist / Senior Software Engineer · **Progrexion**

Salt Lake City, UT · Mar 2018–Mar 2020

- Led ML model integration into application workflows, serving models behind RESTful services

Data Scientist / Senior Software Engineer · **Progrexion** Salt Lake City, UT · Aug 2017–Mar 2018

- Built ML models and the RESTful services and asynchronous batch processing around them

Senior Java Software Engineer · **Progrexion** Salt Lake City, UT · Oct 2016–Aug 2017

- Built backend Java services

Senior Application Development Consultant · **Goldman Sachs (via NTT DATA)**

Salt Lake City, UT · Apr 2015–Oct 2016

- Client-facing consultant embedded with Goldman Sachs engineering

Senior Software Engineer · **McDonald's Corporation (IGATE)**

Chicago, IL / Pune, India · Nov 2011–Apr 2015

- Designed and built Java RESTful services, from requirements gathering with business users through production release
- Owned code reviews, testing (JUnit, Mockito), and UAT support

EDUCATION

Bachelor of Technology, Computer Science and Engineering
Jawaharlal Nehru Technological University (JNTU), India

SKILLS

Software Architecture | Distributed Systems | Go | Python | Java | C# | JavaScript | PostgreSQL

Redis | Apache Kafka | Microservices | RESTful APIs | CI/CD | Machine Learning | Data Science | Engineering Leadership

Also working with as of 2026, evidenced by the work described in this resume:

Agentic AI Systems | AI Coding Agents | Model Context Protocol (MCP) | Agent2Agent Protocol (A2A) | LLM Evaluation & Benchmarking | Temporal | Local LLM Inference (Apple MLX) | Docker | TypeScript | Flutter | Firebase | Google Cloud Run

PUBLIC REPOS

buildgate

Unattended agent factory: takes a ticket and a spec, drives a coding agent through a sandboxed build-and-verify loop, and hands a human a reviewable pull request. Merge stays human by design. Go + Temporal, React console, MCP endpoint.

pi-harness

Extensions, skills and prompts that harden the pi coding agent: contract tests, a diff quality gate, an external-effect guard, Docker containment.

todo-kafka-service

Go API whose writes flow through Kafka into Postgres, with Redis for caching and idempotency keys; idempotent consumers and redelivery on failure.

my-mario

A Super Mario–style browser game, live on GitHub Pages at ljammula.github.io/my-mario.
